Environmental Sciences

Quality Control of SNP data with preGSf90 or qcf90

Quality control

Which software in the
BLUPF90 family?

- Call rate
 - Animals
 - SNP
- Minor Allele Frequency (MAF)
- Hardy-Weinberg Equilibrium (HWE)
- Non-mapped SNP
- Mendelian Conflicts
- Duplicate genotypes
- Linkage disequilibrium (LD)

preGSf90

- Interface program to the genomic module to process the genomic information in the BLUPF90 family of programs

preGSf90

- Performs Quality Control of SNP information
- Creates the genomic relationship matrix
 - and relationships based on pedigree
 - Inverse of relationship matrices

preGSf90

- Same parameter file as for all BLUPF90 programs
- Needs an extra OPTION in renf90.par
 - `OPTION SNP_file marker.geno`
- Reads 2 extra files (besides data and pedigree):
 - `marker.geno`
 - `marker.geno_XrefID` (created by renumf90)

`_XrefID` has 2 columns: Renumbered ID Original ID

Run renumf90 before preGSf90

- Use renumf90 for renumbering data and creating XrefID and files

New pedigree file from RENUMF90

- **1 - renumbered animal ID**
- 2 - parent 1 number or UPG
- 3 - parent 2 number or UPG
- 4 - 3 minus number of known parents
- 5 - known or estimated year of birth
- **6 - number of known parents**
if animal is genotyped 10 + number of known parents
- 7 - number of records
- 8 - number of progenies as parent 1
- 9 - number of progenies as parent 2
- **10 - original animal ID**

SNP file, XrefID, and ped from renumf90

SNP File

First col: original ID

Second col: SNP genotypes {codes: 0,1,2, and 5 (missing)}

All SNP should start in the same column!!!

```
80 211010110020120110110101101111
8014 211101015111011202211101115111

8474 8691 9908 1 3 12 1 0 0 8014
406 8691 9825 1 3 12 1 0 2 516
9441 8691 8829 1 3 12 1 0 0 181
```

Original ID

preGSf90

- Same parameter file as for all BLUPF90 programs
- Needs an extra OPTION in renf90.par
 - `OPTION SNP_file marker.geno`
- Reads 2 extra files (besides data and pedigree):
 - `marker.geno`
 - `marker.geno_XrefID` (created by renumf90)

`_XrefID` has 2 columns: Renumbered ID Original ID

Output Files from preGSf90

- freqdata.count
 - Contains the calculated allele frequency before QC
- freqdata.count.after.clean
 - Contains allele frequencies as used in calculations, removal code
 - AF will be zero for removed SNP
- Gen_call_rate
 - List of animals removed by low call rate
- Gen_conflicts
 - Report of animals with Mendelian conflicts
- GimA22i
 - Stores the content of the $\mathbf{G}^{-1} - \mathbf{A}_{22}^{-1}$
 - Only if preGSf90 is used, not in other programs

Quality control default exclusion

- MAF
 - SNP with $MAF < 0.05$
- Call rate
 - SNP with call rate < 0.90
 - Individuals with call rate < 0.90
- Monomorphic
 - Excludes monomorphic SNP

Quality control default exclusion

- Parent-progeny conflicts (SNP & Individuals)
 - Exclusion -> opposite homozygous
 - For SNP: Number of parent-progeny exclusion from the total of pairs evaluated (>10 %)
 - For Individuals: Number of parent-progeny exclusions as percentage of all SNP (> 1%)

Parent-progeny conflicts

- Presence of these conflicts results in a negative **H**
- Problems in estimation of variance components by REML, programs may not converge, etc.
- Solution:
 - Report all conflicts, with counts for each individual as parent or progeny to trace the conflicts
 - Remove progeny genotype
 - maybe not the best option (problem may be in the pedigree)
 - But results in a positive-definite **H**

Parent-progeny conflicts

- OPTION verify_parentage x
 - 0: no action
 - 1: only detect
 - 2: detect and search for an alternate parent; no change to any file. Not implemented
 - implemented in **seekparentf90** program
 - 3: detect and eliminate progeny with conflicts (default)

Control default values

- For MAF
 - OPTION minfreq x
- Call rate
 - OPTION callrate x
 - OPTION callrateAnim x
- Mendelian conflicts
 - OPTION exclusion_threshold_snp x
 - OPTION exclusion_threshold x

Other Options

- Departure of heterozygous from Hardy-Weinberg Equilibrium

```
OPTION hwe x
```

- Exclusion of selected chromosomes:

```
OPTION excludeCHR n1 n2 n3...
```

- Inclusion of selected chromosomes:

```
OPTION includeCHR n1 n2 n3...
```

- Exclude samples from analyses

```
OPTION excludeSample n1 n2 n3...
```

- Inform which are the sex chromosomes:

```
OPTION sex_chr n
```

- Chromosome $\geq n$ will be excluded only for HWE and parent-progeny checks, but not for calculations

Heritability of gene content

```
OPTION h2_gene_content
```

It checks that the heritability of gene content is equal or close to 1 as described in Forneris et al. *Genetics* 199.3 (2015): 675-681. Markers with estimated $h^2 < 0.98$ **and** significant p-values of the LRT ($p < 0.01$) are discarded. In addition, heritability and status of each marker are written in file `h2_gc_test`.

The test is useful for homogenous populations (breeds) but theory does not hold for crossbred animals. This test uses explicitly `inv(A22)` so it is not suitable for very large populations.

LD calculation and options

```
OPTION calculate_LD
```

Calculate LD as the squared correlation of allele counts for two SNP

Results are stored in "ld_results", columns: snp_i, chr_i, pos_i, freq_i, snp_j, chr_j, pos_j, freq_j, dist_ij, Rsq_ij

```
OPTION LD_by_chr
```

Calculate LD within chromosome

```
OPTION LD_by_pos x
```

Calculate LD within chromosome and windows of SNP based on position optional parameter x define with windows size in Bp, default value 200000

```
OPTION filter_by_LD x
```

Filter SNP with $Rsq > \text{threshold}$. Optional parameter x define the threshold. default value 0.8

```
OPTION thr_output_LD x
```

Threshold to print out Rsq between pair of SNP Optional parameter x define the threshold. default value 0.1

SNP map file – new default

- OPTION chrinfo <file>
- OPTION map_info <file>
 - For GWAS and QC
- Format:
 - No defined position if a header is provided
 - Names for SNP, chromosome, and physical position are mandatory
 - SNPID for SNP
 - CHR for chromosome
 - POS for position

```
NUM CHR   POS      SNPID      NUM2
31428 14 7928189 ARS-BFGL-BAC-1020 2

24827 10 84516867 ARS-BFGL-BAC-11025 18
25865 11 21276136 ARS-BFGL-BAC-11039 21
```

Saving 'clean' files

- SNP excluded from QC are set to missing (i.e., Code=5)
 - 5 is replaced by 0 in calculations
- OPTION saveCleanSNPs
- Save clean genotype data without excluded SNP and individuals
 - For example, for a SNP_file named *marker.geno*
 - Clean files will be:
 - *marker.geno_clean*
 - *marker.geno_clean_XrefID*
 - Removed SNP/animals will be output in files:
 - *marker.geno_SNPs_removed*
 - *marker.geno_Animals_removed*

Only QC in preGSf90

- Quality control
- Genomic relationship matrices and inverses
 - Inverse is costly
- How to do only QC avoiding the inverses:
 - OPTION SNP_file *marker.geno*
 - OPTION saveCleanSNPs
 - OPTION createGInverse 0
 - OPTION createA22Inverse 0
 - OPTION createGimA22i 0

No QC in the application programs

- ONLY use:
 - If QC was performed in a previous run
 - and “clean” genotype file is used
- OPTION SNP_file *marker.geno_clean*
- OPTION no_quality_control

Use in application programs

- Use `renumf90` for renumbering and creation of XrefID and files

SNP_FILE

marker.geno

```
EFFECT
1 cross alpha
RANDOM
animal
FILE
ped3.txt
FILE_POS
1 2 3 0 0
SNP_FILE
marker.geno
PED_DEPTH
0
(CO)VARIANCES
0.30
```

- Run `preGSf90` with quality control, saving clean files
- Run further programs with clean files as needed
 - `blupf90+`, `gibbs2f90+`, ...

PreGSF90 / PostGSF90

`PreGSF90` is an interface program to the `genomic` module to process the genomic information for the `BLUPF90` family of programs

This page also describes some options for `PostGSF90` which is designed for genome-wide association study (GWAS).

Ignacio Aguilar and Ignacy Misztal, University of Georgia
email: iaguilar@inia.org.uy; ignacy@uga.edu
01/29/09 - 07/30/14

Summary

Program `PreGSF90` helps to implement the genomic selection following the single-step methodology as presented by [Aguilar et al. 2010 JDS](#).

In this methodology the relationship matrix **A** based on the pedigree information is replaced by matrix **H**, which combines the pedigree and genomic information.

The main difference between \mathbf{A}^{-1} and \mathbf{H}^{-1} is matrix of structure
$$\text{GimA22i} = \text{inv}(\mathbf{G}) - \text{inv}(\mathbf{A}_{22}),$$
where **G** is a genomic relationship matrix and **A₂₂** is a relationship matrix for genotyped animals.

Efficient methods for the creation of the genomic relationship matrix, relationship based on pedigree and their inverses are described in [Aguilar et al., 2011 JABG](#).

Program `PreGSF90` could be run after `RENUMF90`.

It is also run automatically by application programs like `BLUPF90`, `REMLF90`, `GIBBSxF90` or `BLUP90IOD` when their parameter file contains `OPTION SNP_file filename`.

qcf90

Yutaka
Masuda

- Quality control tool for large genomic data
 - What is an efficient way to detect genomically identical animals?
 - It implies we should compare all pairs of genotyped animals
 - Checks for human error or identical twins before GS
- Huge data and slow operations
 - More than 5 million genotyped Holsteins!
 - $80\text{K SNPs} \times [5\text{M} \times 5\text{M}] / 2 \sim 1 \times 10^{18}$ comparisons needed
- The other checks are also needed...
 - Call rate, low MAF, Mendelian conflicts, etc.

qcf90

- Four states for a biallelic SNP

Genotype	Character	ASCII (8bits)	Re-coded (2bits)
Homozygote (AA)	"0"	00110000	01
Heterozygote (Aa)	"1"	00110001	11
Another Homozygote (aa)	"2"	00110010	10
Missing	"5"	00110101	00

- Task: read and keep 5M genotypes in memory
 - Regular format: 3 TB RAM
 - Efficient format (packed): 93 GB RAM

qcf90

- Logical manipulation of bit pattern
 - Fortran has functions for bitwise operations
 - Logical manipulation on bit pattern

– Typical operations:

	1100		1100		1100		
AND	1010	OR	1010	XOR	1010	NOT	1010
	----		----		----		----
	1000		1110		0110		0101

– Population count: the number of 1's

```
popcnt(0000) is 0
popcnt(0010) is 1
popcnt(1010) is 2
```

qcf90

- qcf90 supports raw files
 - No need to run renumf90 before
- qcf90 was designed for QC
 - preGSf90 was designed for QC and constructing **G** and **A₂₂**
- `qcf90 --snpfile snpdata.txt --pedfile pedigree.txt`
 - No parameter file but same output as preGSf90
- `qcf90 --help` or `qcf90 --long-help`
 - For all the options

qcf90

Yutaka
Masuda

- Benchmark test:
 - Holstein genotypes: 569,404
 - Number of SNP: 60,671
 - Number of animals in pedigree: 10,710,380

3x faster
28x less memory

Step	QCF90 (sec.)	PREGSF90 (sec.)
Reading a SNP file	420	1407
MAF and call rate	150	245
HWE test	84	24
Call rate for animals	3	307
Mendelian tests for SNP	62	316
Mendelian tests for animals	62	248
Recalculation of MAF	136	161
Total	917	2708
Memory usage	9 GB	257 GB

pipeline

qcF90

- Use statement to save clean files: `--save-clean`

renumF90

- Use clean SNP and map (if present) files

blupF90+ or other application program

- Use clean SNP and map (if present) files
- Use renumbered files from renumF90
