

Factor analysis

Main aims of multivariate statistics

- ✓ **Reduction of system dimensions**
- ✓ **Search for latent structures**
- ✓ **Analysis of dependence relationships**

- ✓ **Definition of covariance structure**
- ✓ **New variables with technical or biological meaning**
- ✓ **Latent structure that regulates the covariance of the system**

Search for latent structures

PCA is aimed at reducing the dimensions of the system

Factor analysis fits a theoretical model of the structure of the correlation matrix

Factor Analysis

- ✓ **Proposed by Galton at the end of the 800 and further developed by Pearson and Spearman**
- ✓ **Interpretation of learning tests**
- ✓ **Theoretical assumption on the covariance structure of a multivariate system**

Factor Analysis

Variability of each X_i in a multivariate system

- ✓ Quota shared with other variables

COMMUNALITY

- ✓ Quota specific for each variable

UNIQUENESS

The factorial model of the covariance

The (co)variance matrix of a system could be decomposed

$$\mathbf{S} = \mathbf{B}\mathbf{B}' + \mathbf{\Psi}$$

S = (Co)variance matrix of original data

B = (Co)variance between original data and latent factors

$\mathbf{\Psi}$ = Specific variance matrix

The factorial model

The original variables are represented as linear functions of a smaller number (q) of latent common factor variables and of a single latent specific variable:

$$\mathbf{X}_1 = \mathbf{b}_{11}\mathbf{Y}_1 + \mathbf{b}_{12}\mathbf{Y}_2 + \dots + \mathbf{b}_{1q}\mathbf{Y}_q + \mathbf{e}_1$$

$$\mathbf{X}_2 = \mathbf{b}_{21}\mathbf{Y}_1 + \mathbf{b}_{22}\mathbf{Y}_2 + \dots + \mathbf{b}_{2q}\mathbf{Y}_q + \mathbf{e}_2$$

.....

....

$$\mathbf{X}_p = \mathbf{b}_{p1}\mathbf{Y}_1 + \mathbf{b}_{p2}\mathbf{Y}_2 + \dots + \mathbf{b}_{pq}\mathbf{Y}_q + \mathbf{e}_p$$

The factorial model

$$X_1 = b_{11}Y_1 + b_{12}Y_2 + \dots + b_{1q}Y_q + e_1$$

.....

Y_j = j -th common factor,

b_{ij} = factor loading, i.e. parameter that reflects the importance of the j -th factor in the composition of the i -th original variable (factorial load or loading)

e = specific casual variable for X_i

Difference between factor analysis and PCA

The j-th principal component

$$Y_j = a_{1j}X_1 + a_{2j}X_2 + \dots + a_{pj}X_p$$

The factor model

$$X_p = b_{p1}Y_1 + b_{p2}Y_2 + \dots + b_{pq}Y_q + e_p$$

Factors are called common because generates the covariances among the original variables

The factorial model in matrix terms

$$\begin{bmatrix} X_1 \\ X_2 \\ \dots \\ X_p \end{bmatrix} = \begin{bmatrix} b_{11} & b_{12} & \dots & b_{1q} \\ b_{21} & b_{22} & \dots & b_{2q} \\ \dots & \dots & \dots & \dots \\ b_{p1} & b_{p2} & \dots & b_{pq} \end{bmatrix} \begin{bmatrix} Y_1 \\ Y_2 \\ \dots \\ Y_q \end{bmatrix} + \begin{bmatrix} e_1 \\ e_2 \\ \dots \\ e_p \end{bmatrix}$$

$$\mathbf{X} = \mathbf{B}\mathbf{Y} + \mathbf{e}$$

The matrix of factor loadings

$$\mathbf{B} = \begin{bmatrix} b_{11} & b_{12} & \dots\dots\dots & b_{1p} \\ b_{21} & b_{22} & \dots\dots\dots & b_{2p} \\ \vdots & \vdots & \vdots & \vdots \\ b_{p1} & b_{p2} & \dots\dots\dots & b_{pp} \end{bmatrix}_{(p \times p)}$$

b are correlations between factors and original variables

B allows for interpreting the factorial structure

The factorial model of the covariance

Diagonal elements of **BB'**

$$\sigma_i^2 - \Psi_i = \sum_{j=1}^q b_{ij}^2$$

Are the **communality** of original variables

Called also h^2

Factor analysis

- ✓ Estimation of loading matrix **B**
- ✓ Estimation of uniqueness matrix Ψ
- ✓ Different methods
- ✓ Constraint of the communalities

Factor analysis:

The principal component method

Similar to PCA

Differences in **R** structure

$$\mathbf{R} = \begin{bmatrix} 1 & r_{12} & \dots & r_{1p} \\ r_{21} & 1 & \dots & r_{2p} \\ \dots & \dots & \dots & \\ r_{p1} & r_{p2} & & 1 \end{bmatrix} \quad \ddot{\mathbf{R}} = \begin{bmatrix} h_1^2 & r_{12} & \dots & r_{1p} \\ r_{21} & h_2^2 & \dots & r_{2p} \\ \dots & \dots & \dots & \\ r_{p1} & r_{p2} & & h_p^2 \end{bmatrix}$$

Communalities have to be estimated a priori

Factor analysis: ML method

- ✓ Iterative
- ✓ Test for establishing the number of factors to be extracted
- ✓ **In PCA the factorisation of R is unique**
- ✓ **In factor analysis no**

Factor rotation:

The concept of simple structure of B

- ✓ Each factor should have very large loadings for few variables e many close to zero for the others
- ✓ A variable should have a large loading only for one factor and close to zero for the other factors
- ✓ Variables with common origin, type etc. should be associated to the same factor
- ✓ Loading matrix **B** could be modified trough the **rotation**

Factor rotation: Analytical aspects

Factor rotation consists in the right multiplication of the loading matrix **B** by an orthogonal matrix **T**

$$\mathbf{S} = \mathbf{B}\mathbf{B}' + \mathbf{\Psi}$$

Right-multiplying **B** by **T**

$$\mathbf{S} = \mathbf{B}\mathbf{T}(\mathbf{B}\mathbf{T})' + \mathbf{\Psi} = \mathbf{B}\mathbf{T}\mathbf{T}'\mathbf{B}' + \mathbf{\Psi} = \mathbf{B}\mathbf{B}' + \mathbf{\Psi}$$

Factor rotation:

Geometrical aspects

- ✓ Factorial space with q dimensions
- ✓ Axis are the factors
- ✓ The dots are the variables
- ✓ Coordinates on factorial axis are the correlations of the variables with the factors (loadings)
- ✓ Factor rotation is equivalent to a rigid rotation of the axis in the q dimensions of the factorial space

Factor rotation: Geometrical aspects

- Space defined by two factors (F_1 e F_2)

Factor rotation: Geometrical aspects

- Factors are orthogonally rotated (F_1^* e F_2^*)

Methods of Factor rotation

Orthogonal

VARIMAX = maximisation of squared weight sum within each column of **B**

QUARTIMAX = maximisation of squared weight sum within each row of **B**

Oblique

OBLIMIN, PROMAX

Steps of Factor analysis

1.Assessment of data suitability

2.Evaluation of number of factors to extract

3.Factor extraction

4.Rotation and interpretation

5.Evaluation of goodness of extracted factors

6.Factor score calculation

Factor analysis assumes the existence of a latent structure that generates the covariance among observed variables

X_1 and X_2

$r_{x_1x_2}$

A third variable,

X_k ,

could explain part of the relationships between X_1 e X_2

$R_{x_1x_2,k}$ = *partial correlation between X_1 and X_2 given X_k*

Comparison between Pearson and partial correlations

	MILK1	MILK2	MILK3	MILK4	MILK5	MILK6
MILK1	*	0.85	0.78	0.71	0.61	0.44
MILK2	0.53	*	0.88	0.81	0.71	0.54
MILK3	0.14	0.42	*	0.87	0.79	0.61
MILK4	0.03	0.13	0.40	*	0.86	0.69
MILK5	-0.01	0.01	0.13	0.43	*	0.79
MILK6	-0.08	-0.00	-0.00	0.07	0.54	*

Comparison between Pearson and partial correlations

If Pearson correlations are high and partial correlations are small the existence of a latent structure can be hypothesized

The data set could be considered suitable for factor analysis

An index to assess suitability for factor Analysis is the Kaiser Measure of Sample Adequacy MSA

$MSA > 0,75$ for good suitability

Steps of Factor analysis

1. Assessment of data suitability

2. Evaluation of number of factors to extract

3. Factor extraction

4. Rotation and interpretation

5. Evaluation of goodness of extracted factors

6. Factor score calculation

Evaluation of number of factors to extract

- ✓ **Relevant literature**
- ✓ **Amount of explained variance**
- ✓ **Factor with eigenvalues > 1**
- ✓ **Statistical test**

Evaluation of number of factors to extract

Steps of Factor analysis

1. Assessment of data suitability

2. Evaluation of number of factors to extract

3. Factor extraction

4. Rotation and interpretation

5. Evaluation of goodness of extracted factors

6. Factor score calculation

Factor rotation and interpretation

	Factor1	Factor2	Factor3	Factor1	Factor2	Factor3
Milk	-0,36	0,71	-0,09	0,04	0,76	-0,25
Fat	0,02	-0,32	0,88	-0,04	-0,11	0,93

pH	0,65	-0,32	-0,21	0,37	-0,64	-0,13

Evaluation of goodness of extracted factors

Factors generate the correlation matrix through the loading matrix **B**

$$\mathbf{R} = \mathbf{B}\mathbf{B}' + \mathbf{\Psi}$$

Thus

$$\mathbf{R} - \mathbf{B}\mathbf{B}' = \mathbf{\Psi}$$

$$\mathbf{\Psi} = \begin{bmatrix} \Psi_1 & 0 & \dots & 0 \\ 0 & \Psi_2 & \dots & 0 \\ \dots & \dots & \dots & \dots \\ 0 & 0 & \dots & \Psi_p \end{bmatrix}$$

Evaluation of goodness of extracted factors

R

$$\begin{bmatrix} 1 & 0.83 & 0.78 & 0.73 & 0.68 & 0.61 & 0.50 \\ & 1 & 0.89 & 0.85 & 0.79 & 0.72 & 0.62 \\ & & 1 & 0.90 & 0.86 & 0.79 & 0.68 \\ & & & 1 & 0.90 & 0.84 & 0.74 \\ & & & & 1 & 0.89 & 0.80 \\ & & & & & 1 & 0.86 \\ & & & & & & 1 \end{bmatrix} =$$

symm

BB'

$$\begin{bmatrix} 0.73 & 0.81 & 0.79 & 0.75 & 0.68 & 0.60 & 0.49 \\ & 0.90 & 0.89 & 0.86 & 0.80 & 0.72 & 0.61 \\ & & 0.91 & 0.89 & 0.86 & 0.79 & 0.68 \\ & & & 0.89 & 0.88 & 0.84 & 0.75 \\ & & & & 0.90 & 0.89 & 0.81 \\ & & & & & 0.91 & 0.85 \\ & & & & & & 0.80 \end{bmatrix}$$

symm

Ψ

$$\begin{bmatrix} 0.27 & -0.03 & -0.01 & -0.02 & 0.00 & 0.01 & 0.01 \\ & 0.10 & 0.00 & -0.01 & -0.0 & 0.00 & 0.01 \\ & & 0.09 & 0.01 & 0.00 & 0.00 & 0.00 \\ & & & 0.11 & 0.02 & 0.00 & -0.01 \\ & & & & 0.10 & 0.00 & -0.01 \\ & & & & & 0.09 & 0.01 \\ & & & & & & 0.20 \end{bmatrix}$$

symm

Factor score calculations

Common factor *scores* (\mathbf{f}') could be calculated as:

$$\mathbf{f}' = \mathbf{x}'[(\mathbf{B}\mathbf{B}' + \Psi)^{-1} \cdot \mathbf{B}]$$

Scores could the be used as new phenotypes for further elaborations:

Some examples of use of factor analysis in animal science

- ✓ Analysis of differences between genomic and chromosomal correlation matrices
- ✓ Derivation of indicators of milk quality
- ✓ Analysis of correlation structure of milk fatty acid composition

Dairy Herd Management Types Assessed from Indicators of Health, Reproduction, Replacement, and Milk Production

CARSTEN ENEVOLDSEN,¹ JENS HINDHEDE, and TROELS KRISTENSEN

Danish Institute of Animal Science, Research Centre Foulum,
DK-8830 Tjele, Denmark

TABLE 1. Five, 25, 50, 75, and 95 percentiles¹ of 22 variables describing 111 Danish dairy herds.

Variable	Percentile				
	5	25	50	75	95
1 Herd size, cow years	34	46	59	71	118
2 Mature BW, kg ²	431	605	623	625	625
3 Age at first calving, d	754	798	823	862	939
4 Calving interval, median d to calving or culling	412	393	375	361	346
5 Calf survival, % alive at 6 mo postpartum	77	83	88	92	95
6 Cow survival, % in herd at 12 wk postpartum	88	93	95	96	98
7 Calving rate, calves born per 100 cow years	96	105	111	119	128
8 Livestock sales, no. ³	-23	0	2	10	25
9 Cow age, mean lactation number	1.9	2.2	2.3	2.5	2.9
10 Breeding value for milk, index ⁴	-290	-124	-20	79	241
11 First parity peak milk, kg of ECM ⁵	18	20	23	25	27
12 Cow peak milk, kg of ECM ⁵ (parity ≥3)	25	28	31	33	37
13 First parity persistency, kg of ECM ⁶	0.5	1.3	1.9	2.4	3.6
14 Cow persistency, kg of ECM ⁶ (parity ≥3)	2.7	4.2	4.9	5.7	6.9
15 First parity peak variability (CV), %	6	10	12	16	23
16 Cow peak variability (CV), % (parity ≥3)	6	8	10	13	19
17 First parity persistency variability, 75 to 25 percentile	0.5	1.0	1.0	2.0	2.5
18 Cow persistency variability, 75 to 25 percentile	0.0	1.0	2.0	2.5	4.0
19 Disease-related milk loss, % ⁷	4	5	7	9	11
20 Mastitis level, mean annual SCC	163	236	304	354	414
21 Drug use, administrations per 100 calvings	4	29	63	99	145
22 Milk quota constraints, composite score ⁸	-0.9	-0.4	0.0	0.4	1.0

Factor analysis and farm characteristics

MANAGEMENT TYPES

TABLE 9. Final regression model of total annual milk production in 111 Danish dairy herds. Effects of five second-order factors and mean number of cows.

Variable ¹	df	Regression coefficient	SE	P
1 Replacement intensity	1	21,020	10,279	0.0435
2 Production variability	1	15,039	7224	0.0399
3 Potential peak production	1	-11,319	7881	0.1541
5 Larger cows in younger, open, and larger herds	1	2775	3961	0.4851
6 Cows in the herd, no.	1	6595	152	0.0001

BDep	−0.01	−0.18	0.30	0.05	0.78	0.91		0.88
RWid	0.11	−0.02	0.23	−0.07	0.68	0.71	0.72	

¹BTA18 = *Bos taurus* autosome 18.

Correlation between chromosomal values

- **Correlation structures may differ between chromosomes**
- **Differences may indicate changes in the genetic control of a group of traits**
- **Identification of genes with small additive effects that affect several traits**

How to test differences between matrices?

- ✓ **Issue in population and evolutionary genetics**
- ✓ **Different aspects**
- ✓ **PC are used to explain the variance of a system**
- ✓ **The covariance should be investigated**

ORIGINAL ARTICLE

Dissection of genomic correlation matrices of US Holsteins using multivariate factor analysis

N.P.P. Macciotta¹, C. Dimauro¹, D.J. Null², G. Gaspa¹, M. Cellesi¹ & J.B. Cole²

- Genomic correlation matrices calculated for all BTAs for US Holstein
- Based on genomic evaluations of May 2012 (n. 182,233)
- 31 traits (productive, functional)

The basic idea

Differences in the correlation pattern
among genomic values of different traits

Changes in the quota of variance shared
by all variables (**communality**)

Variation in the latent structure that
controls the (co)variance of the system

Eigenvalue plot comparison

How to test differences?

How to test differences?

Table 9 Regression analysis of communalities extracted from the genomic correlation matrix on those extracted from the different chromosome matrices

BTA	Intercept	p^1	Slope	p^2

Distribution of marker effects for HO Strength (1204 run)

Distribution of marker effects for HO Stature (1508 run)

What happened later?

ARS-BFGL-NGS-109285 at 57,895,121 Mb on BTA18

Signal consistent in HD data

Intronic to a putative CD33-related Siglec gene

This region is gene-rich

Many Siglecs involved in leptin signaling

Also affects gestation length

Maltecca, C., Gray, K. A., Weigel, K. A., Cassady, J. P., Ashwell, M. 2011. A genome-wide association study of direct gestation length in US Holstein and Italian Brown populations. *Animal Genetics* 42:1365-2052.
