# Introduction

$$\underbrace{\begin{bmatrix} \mathbf{X}'\mathbf{X} & \mathbf{X}'\mathbf{Z} \\ \mathbf{Z}'\mathbf{X} & \mathbf{Z}'\mathbf{Z} + \mathbf{A}^{-1}\boldsymbol{\alpha} \end{bmatrix}}_{\mathbf{C}^{-1}} \begin{bmatrix} \hat{\mathbf{b}} \\ \hat{\mathbf{a}} \end{bmatrix} = \begin{bmatrix} \mathbf{X}'\mathbf{y} \\ \mathbf{Z}'\mathbf{y} \end{bmatrix}$$

$$\begin{bmatrix} \mathbf{C}_{11} & \mathbf{C}_{12} \\ \mathbf{C}_{21} & \mathbf{C}_{22} \end{bmatrix} \longrightarrow \mathbf{C}^{-1} = \begin{bmatrix} \mathbf{C}^{11} & \mathbf{C}^{12} \\ \mathbf{C}^{21} & \mathbf{C}^{22} \end{bmatrix}$$

$$\text{PEV} = \text{Var}(g - \hat{g}) = \mathbf{C}^{22} \sigma_e^2$$

$$BIF_{accuracy} = 1 - \sqrt{\frac{PEV}{(1 + F_i)\sigma_u^2}}$$

# Introduction

- Complex Models:
- Single-Step GBLUP:
  - Genomic and pedigree information combined ( $H^{-1}$ ) in a single method

$$\begin{bmatrix} \mathbf{X}'\mathbf{X} & \mathbf{X}'\mathbf{Z} \\ \mathbf{Z}'\mathbf{X} & \mathbf{Z}'\mathbf{Z} + \mathbf{H}^{-1} \end{bmatrix} \alpha \longrightarrow \mathbf{C}^{-1} = \left[ \begin{array}{c} \text{Cartoon Computer} \end{array} \right]$$

- Methods of approximating accuracy
  - Obtain the PEV without setting up the mixed model equations
  - Provide a feasible calculation of the genomic contribution

# Objectives

- Compare two algorithms for approximation of accuracies:

1) Compare approximated accuracies between algorithms

2) Compare approximated and accuracies from the inverse of MME

3) Impact of adding new genotyped animals in the approximated accuracies

# ACCF90GS

Genomic

$$\left\{ \begin{array}{l} \mathbf{Z}'\mathbf{Z} + \lambda\mathbf{A}^{-1} + \lambda \begin{bmatrix} 0 \\ 0 \end{bmatrix} \\ \downarrow \quad \downarrow \\ d_i^r \quad d_i^p \end{array} \right. \left. \begin{array}{l} \mathbf{G}^{-1} \begin{bmatrix} 0 \\ -\mathbf{A}_{22}^{-1} \end{bmatrix} \\ \downarrow \\ d_i^g \end{array} \right\} \longrightarrow LHS_{uu}^{ii} = 1 / (\lambda + \boxed{d_i^r} + \boxed{d_i^p} + d_i^g)$$

Adapted from Misztal and Wiggans (1988):

# ACCF90GS

$$d_i^g = \alpha * [\overline{REL} + (1 - g_{ii}) + Z * (\overline{REL} - REL_{pa})]$$

- $\alpha$  = ratio of residual variance to animal genetic variance
- $REL$  = average of reliability based on pedigree
- $(1-g_{ii})$  = genomic information for the animal  $i$
- $Z$  = adjustment factor defined as:  $\left(\frac{\text{Genotyped individuals}}{100} * 0.1\right)$
- $REL_{pa}$  = average reliability based on the pedigree of genotyped animals with phenotype
- $REL - REL_{pa}$  = contribution from phenotypes of genotyped animals

# ACCF90GS2

- Block sparse inversion of  $\mathbf{G}^{-1}$  computed by the APY method:

$$\text{diag}(\mathbf{Z}'\mathbf{Z} - \mathbf{Z}'\mathbf{X}(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{Z} + \mathbf{G}_{\text{APY}}^{-1})^{-1} \approx \text{diag}(\mathbf{W} + \mathbf{G}_{\text{APY}}^{-1})^{-1}$$

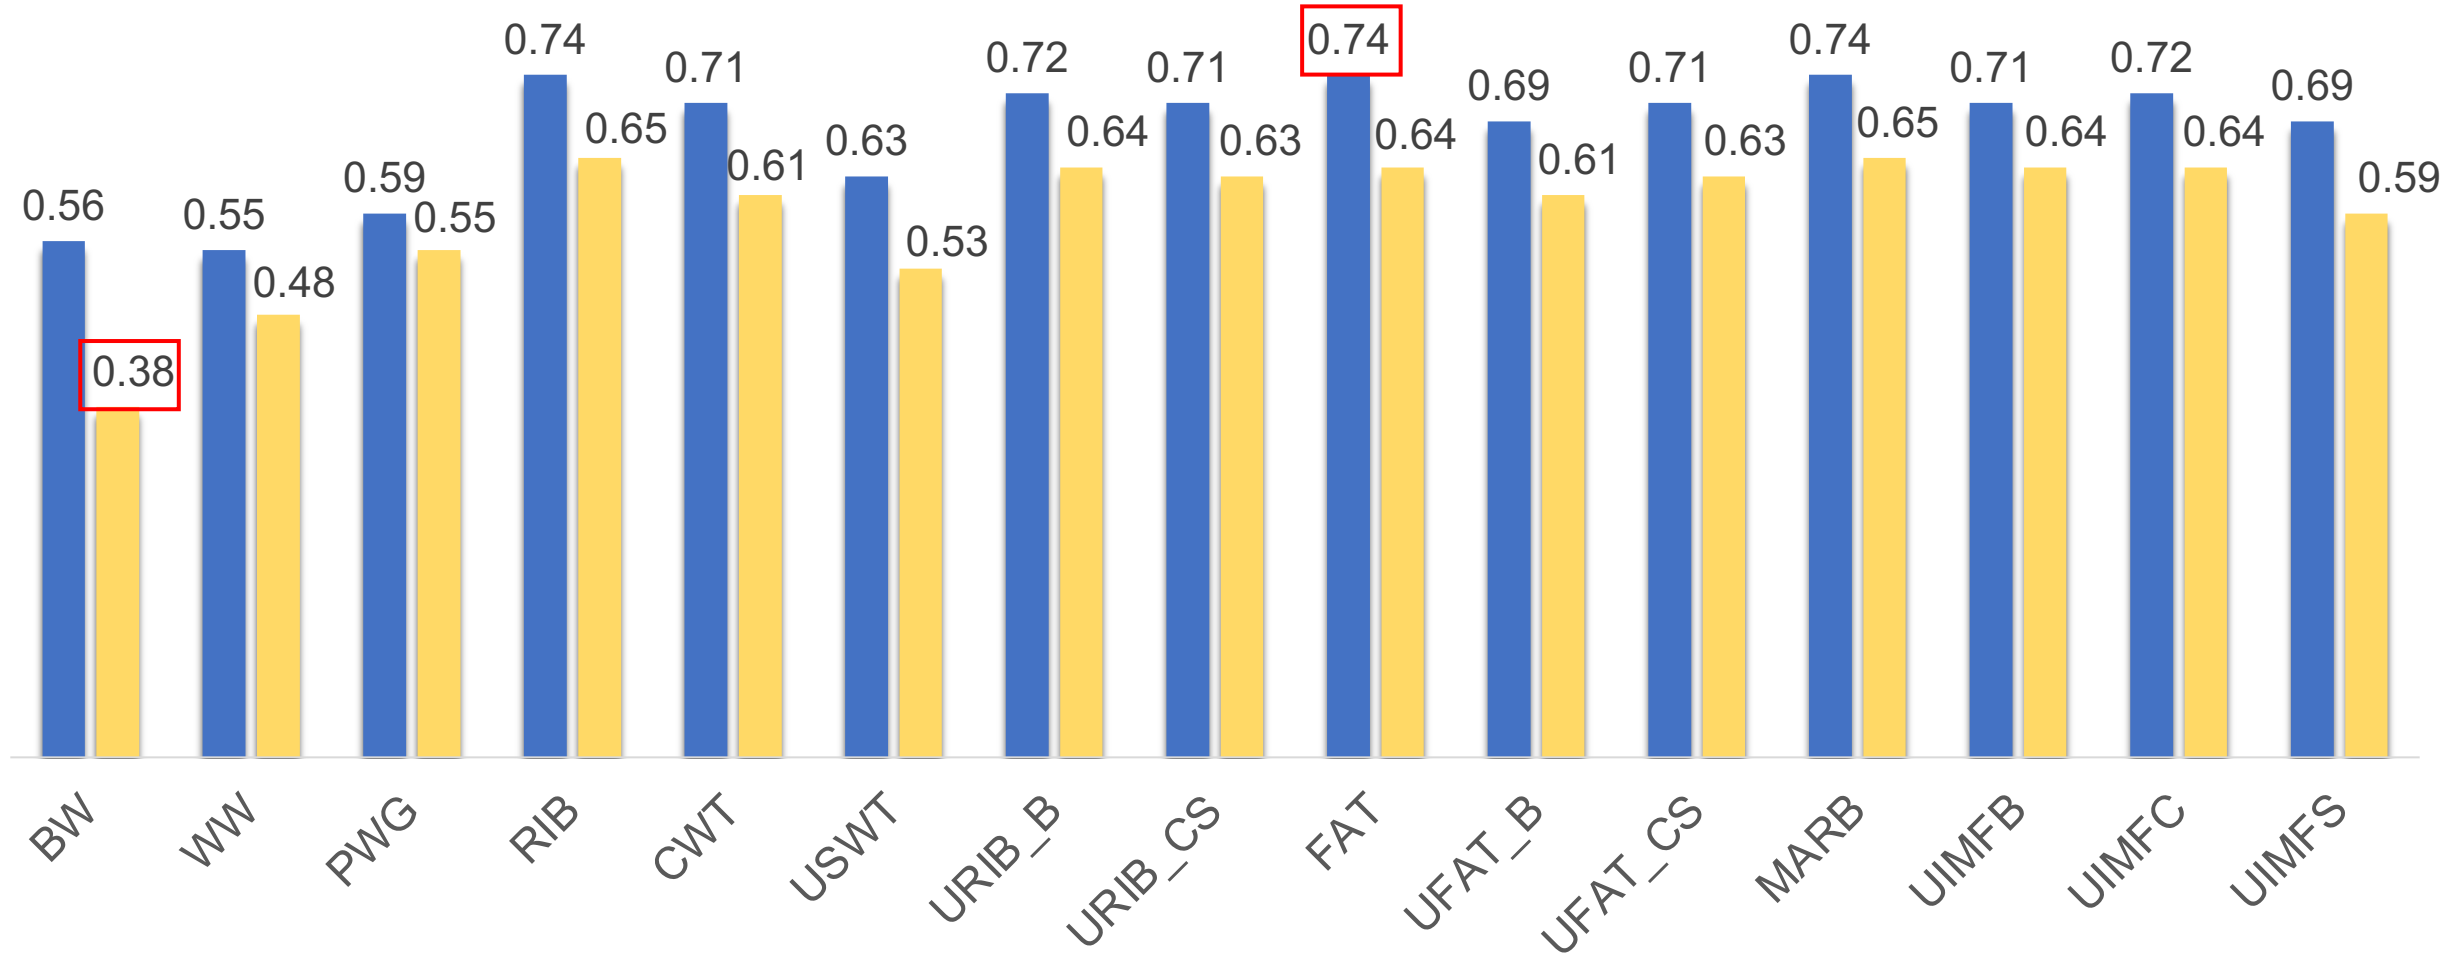

# Data sets

- Dataset:
  - 9.7M Birth weight (BW)
  - 10.1M Weaning weight (WW)
  - 4.9M Postweaning gain (PWG)
  - 132k Carcass weight (CWT)
  - 132k Fat (FAT)
  - 132k Marbling (MARB)
  - 132k Ribeye area (RIB)
  - 2.2M Ultrasound fat (UFAT)
  - 2.2M Ultrasound Ribeye (URIB)
  - 2.6M Weight at ultrasound time (USWT)
  - 2.2M Ultrasound intramuscular fat (UIMF)
- 1.2M Genotyped animals
- 4.3M – 12.5M animals in pedigree
- Subset of data:
  - 31k – 132k records per trait
  - 177k -534k animals in pedigree
  - 30k – 50k Genotyped animals

# Results

# Correlation Between Algorithms

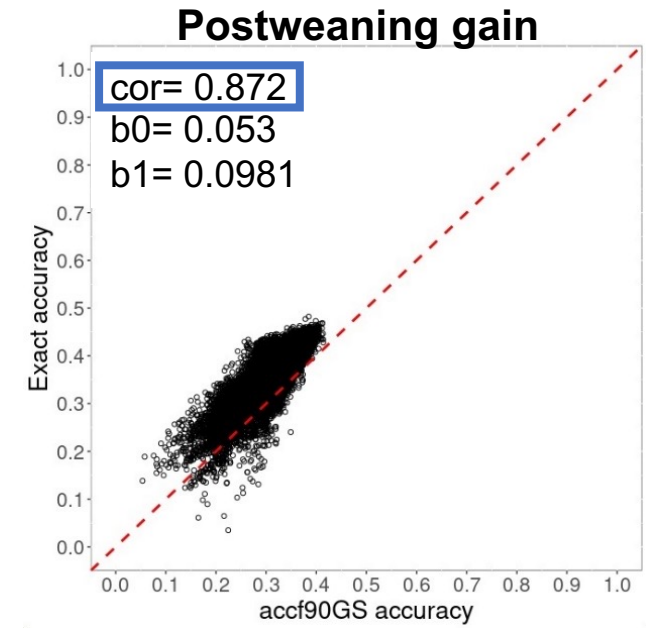

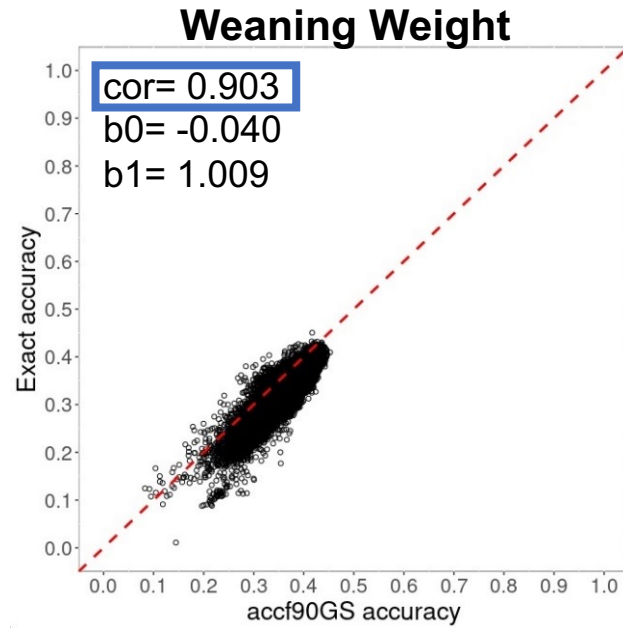

■ Genotyped animals  
 $b_0 = -0.03 - 0.18$   
 $b_1 = 0.54 - 0.74$

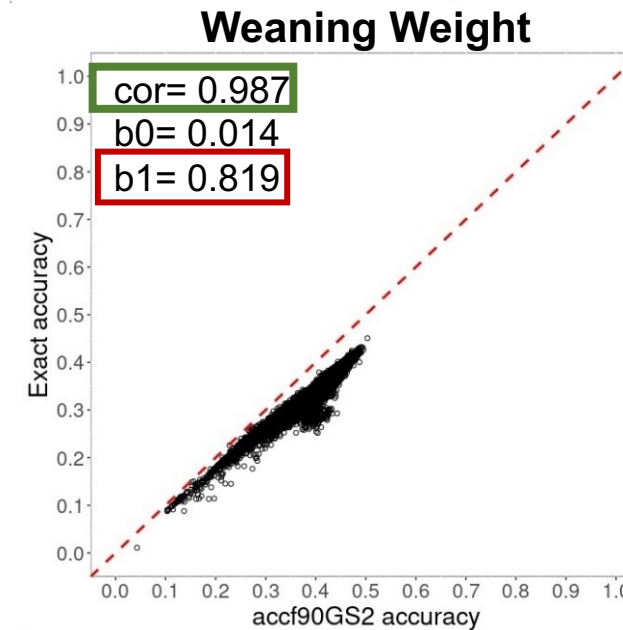

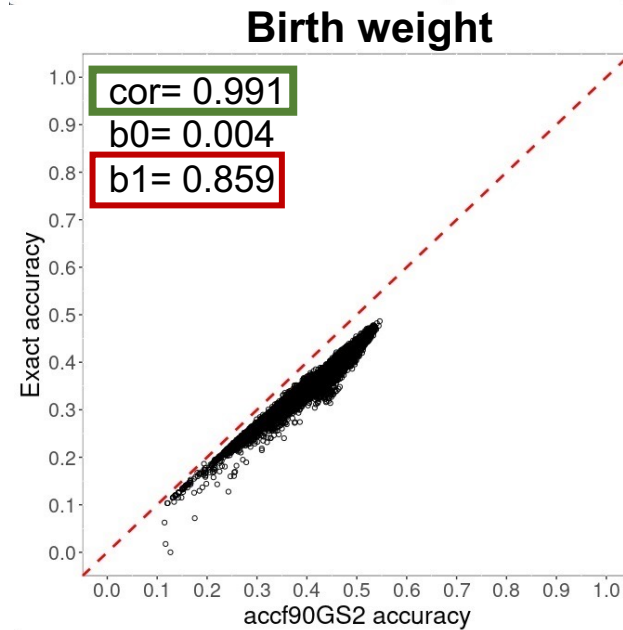

■ Genotyped animals without phenotype  
 $b_0 = -0.07 - 0.30$   
 $b_1 = 0.30 - 0.57$

# **Comparison between approximated and exact accuracies**

ACCF90GS:

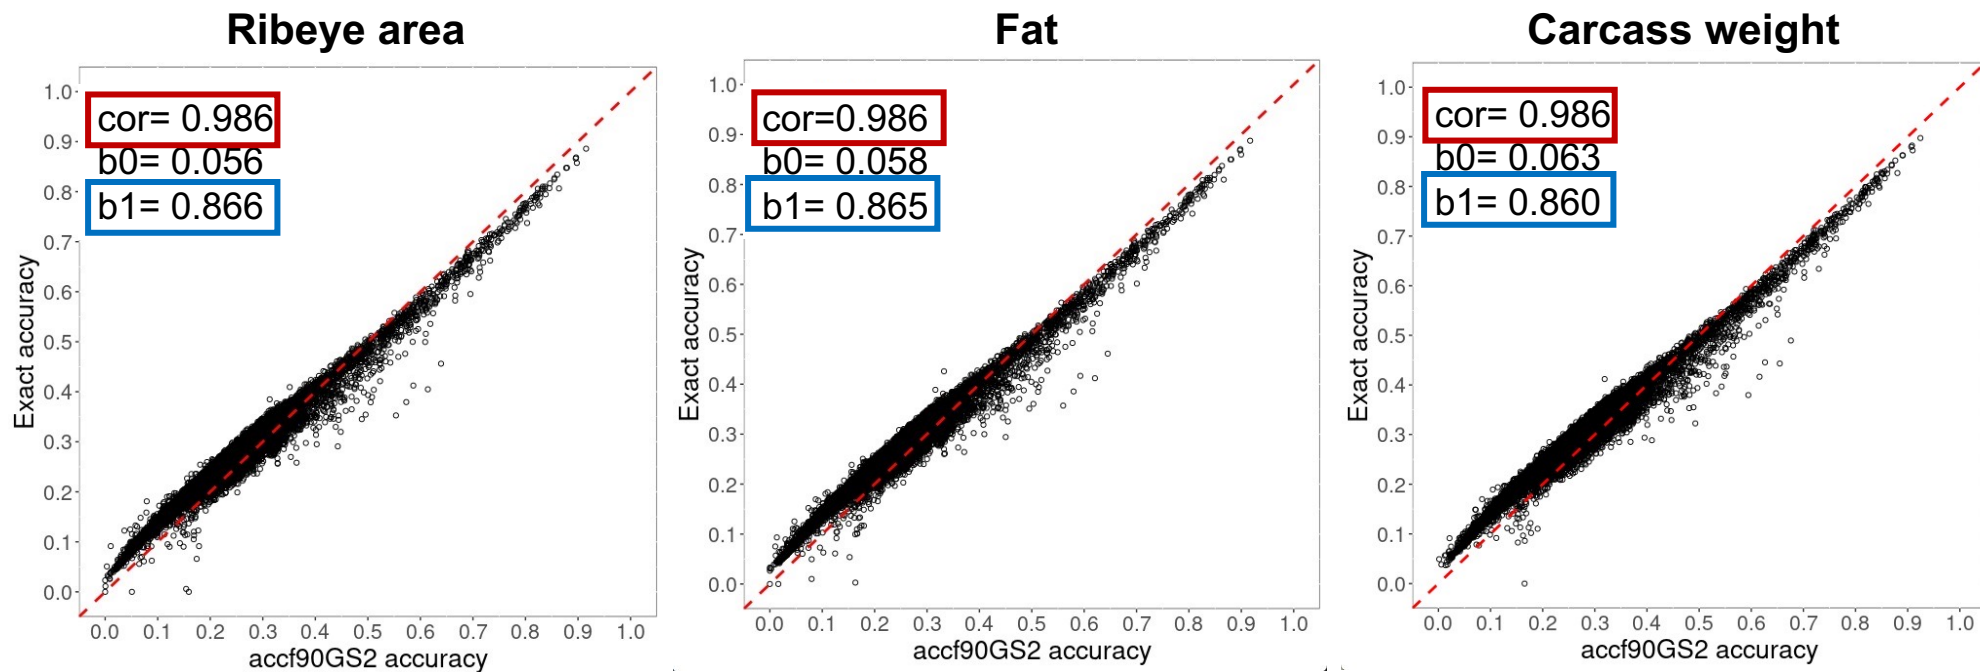

ACCF90GS2:

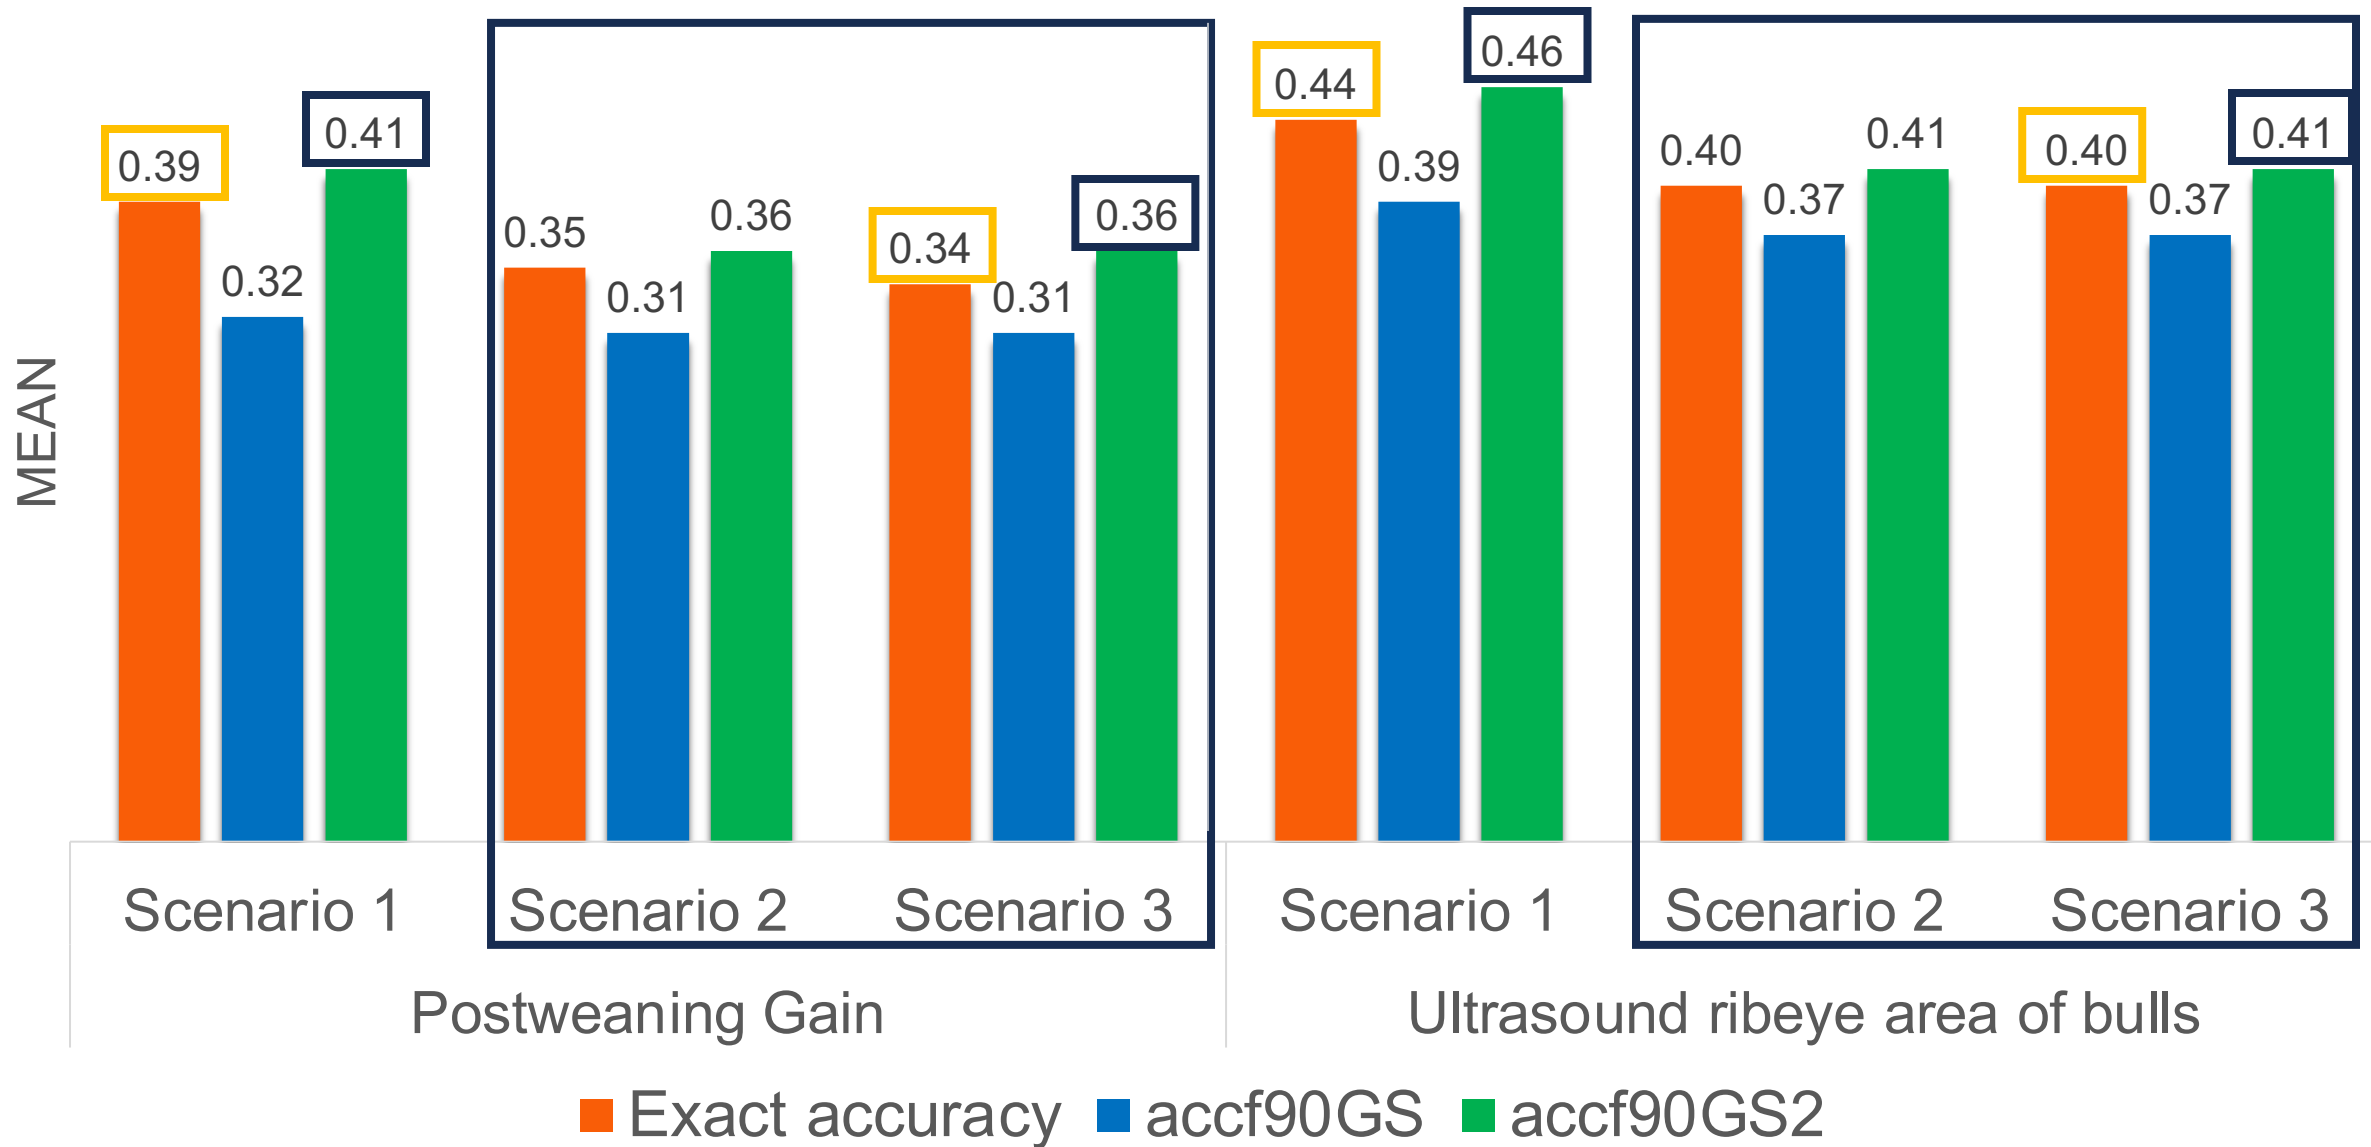

ACCF90GS:

ACCF90GS2:

# **Evaluation of the impact of adding genotyped animals in the approximated accuracies**

Scenario 1= inclusion of 10,000 genotyped animals with phenotype; Scenario 2= inclusion of 10,000 genotyped animals without phenotype; Scenario 3= no inclusion of animals.

# Take home messages

- Approximated accuracies from accf90GS2 are closer to the exact accuracies
- More suitable for approximating accuracies in large-scale routine evaluations
- Computing time may still be challenging
- Adding genotyped animals without phenotypes slightly increases overall accuracy
- Largest impact on the mean is when adding genotyped animals with phenotypes
