

# Selected projects at University of Georgia

Ignacy Misztal and Daniela Lourenco

# Recent projects

- Blupf90 software
  - Convergence improvements
    - Case of #phenotypes  $\ll$  # animals
  - Multiple categorical traits with large data
  - P-values in GWAS with national data sets
- Applications
  - Implementation in dairy
  - Canalization for disease resistance
- Potential negative effects of genomic selection
  - Parameter estimation with large data
- Improvement of accuracies with sequence data
- Explaining peculiarities of GWAS

# WHY GWAS IN UGA / BLUPF90 PROGRAMS

Large research interest in GWAS

Limitations for current methods

- Simple models
- Single trait
- Complicated if not all animals genotyped

Can ssGBLUP be used for GWAS?

# Discrepancies in GWAS methods

## Chicken weight

Manhattan plots by % variance explained by SNP windows

# **INCLUDING SEQUENCE DATA IN US HOLSTEINS**

**4M records for Stature**

**3M Cows**

**4.6M Animals in pedigree**

**27k Genotyped Sires**

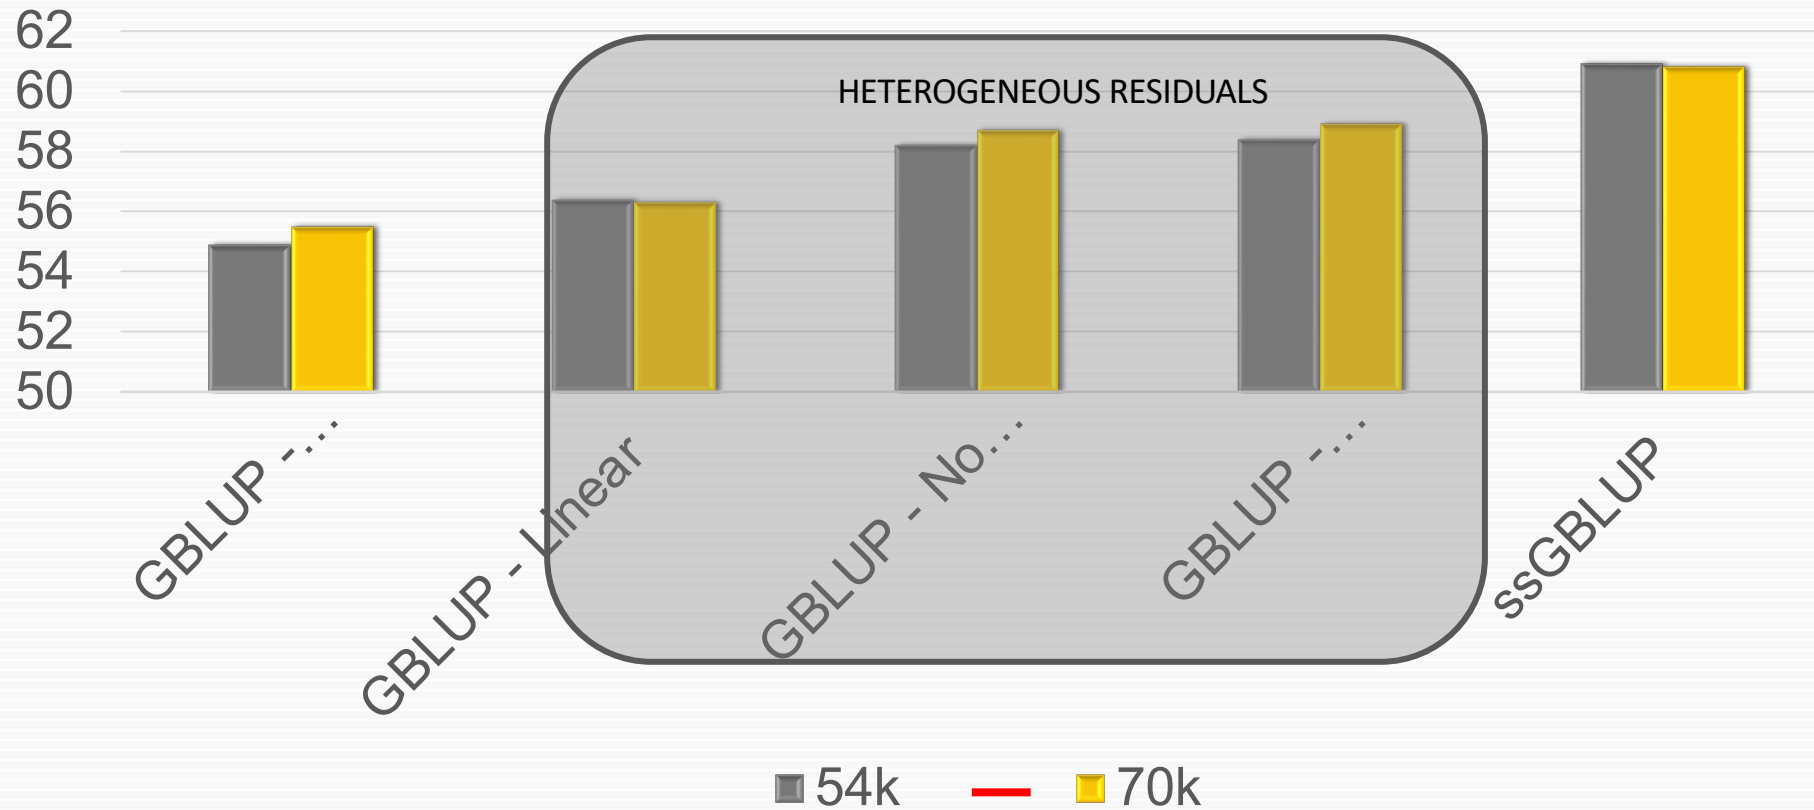

**54k SNP**

**54k SNP + 17k Causative Variants (VanRaden et al., 2017)**

Fragomeni et al. (2019)

# RELIABILITIES WITH DIFFERENT METHODS AND SNP SETS

# P-values for GWAS in (ss)GBLUP

$$pval_i = 2 \left( 1 - \Phi \left( \left| \frac{s\hat{n}p_i}{sd(s\hat{n}p_i)} \right| \right) \right) \quad (\text{Chen et al., 2017})$$

If  $sd(s\hat{n}p_i)$  approximately constant, Manhattan plots based on  $|s\hat{n}p_i|$  and  $pval_i$  similar

Large data – PEV from accuracy approximations based on APY algorithm (Bermann et al., 2021)

# Post-weaning gain in American Angus

## 50k genotyped animals

## 500k genotyped animals

# Sequence project at Roslin Institute

- Contracts with major companies (including PIC and COBB)
- Partly gov't supported
- Headed by John Hickey
- 20 students and postdocs
  
- Steps
  - Imputation to sequence
  - Analyzes

# Largest pig sequence data

**Total = 379k**

# Terminal lines

Jang et al. (2023)  
Jang et al. (accepted)

---

Lines	ADG	BF	ADGX	BFX	Animals in pedigree	Sequenced/ Imputed
-------	-----	----	------	-----	------------------------	-----------------------

---

# Sequence Variants

15M to 20M variants

~ 10M segregated across lines

Should we use all 10M?

# SNP preselection based on GWAS - I

- Top 40k

Extracting only 40k SNP: Similar number as the regular SNP chip (~40k)

# SNP preselection based on GWAS - II

- **Chip+Sign**

Extracting only significant ones + 40k SNP chip

# Steps

## 1) Accuracy of GEBV with SNP preselected from sequence data

- Many animals with sequence

## 2) Single-line and multi-line ssGBLUP evaluations

## 3) Compare ssGBLUP with BayesR from Roslin

Ros-Freixedes et al.  
Genetics Selection Evolution (2022) 54:65

RESEARCH ARTICLE

Open Access

Genomic prediction with whole-genome  
sequence data in intensely selected pig lines

Roger Ros-Freixedes<sup>1,2\*</sup>, Martin Johnsson<sup>1,3</sup>, Andrew Whalen<sup>1</sup>, Ching-Yi Chen<sup>4</sup>, Bruno D. Valente<sup>4</sup>,  
William O. Herring<sup>4</sup>, Gregor Gorjanc<sup>1</sup> and John M. Hickey<sup>1</sup>

# Step 1 – Accuracy with preselected variants

- Prediction accuracy =  $\text{cor}(\text{DEBV}, \text{GEBV})$

# Step 2 – Single vs. Multi-line all traits

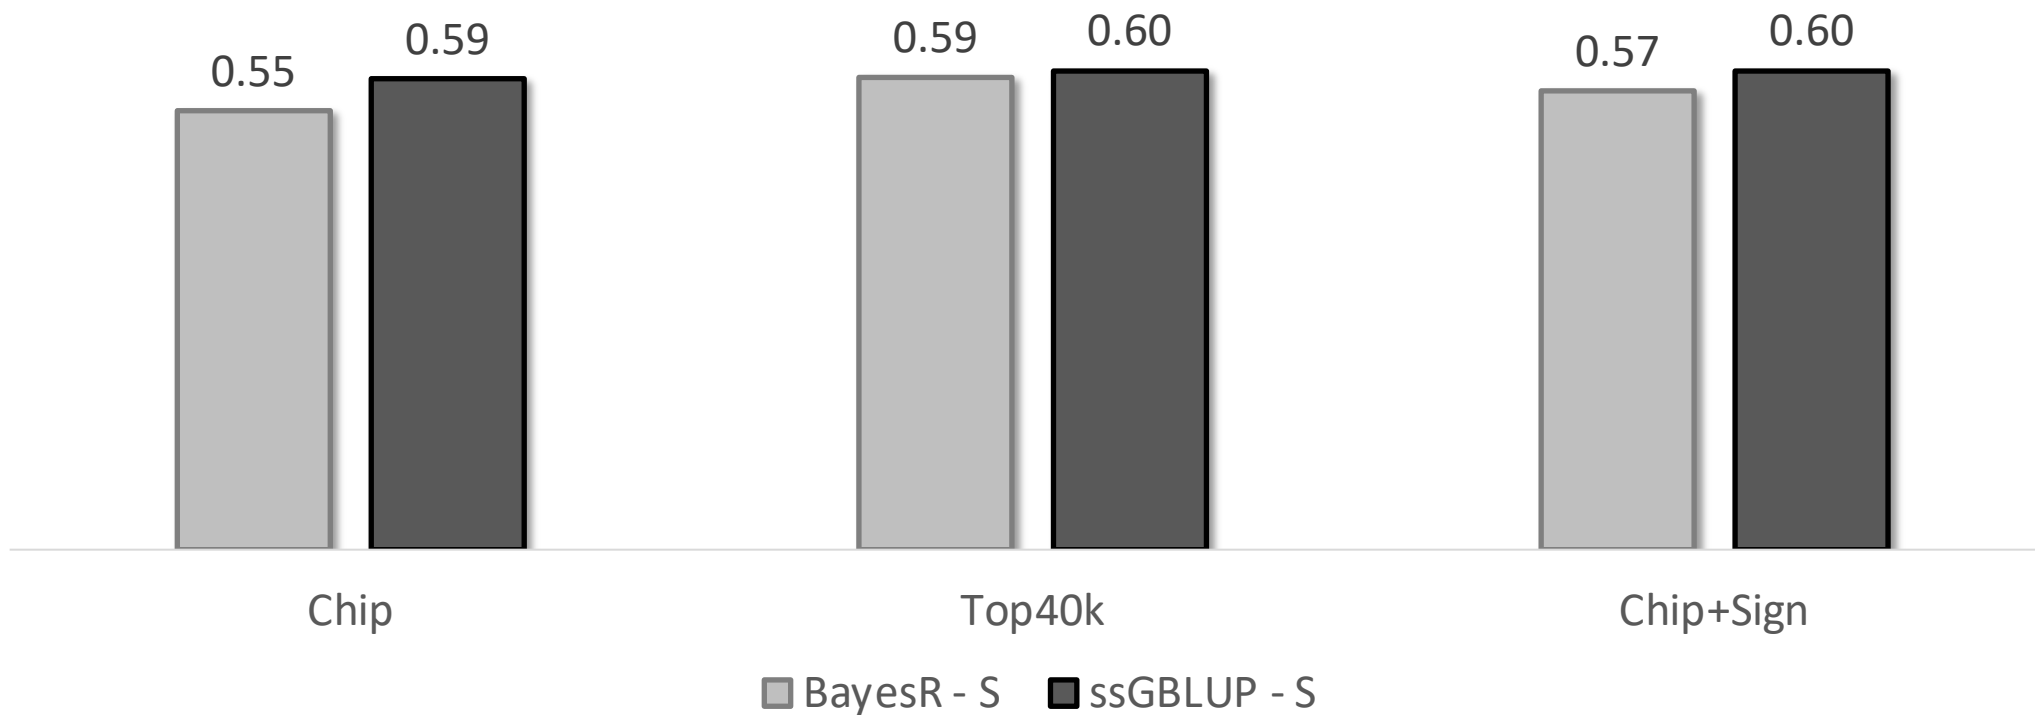

- Prediction accuracy =  $\text{cor}(\text{DEBV}, \text{GEBV})$

Multi-line GWAS and predictions dominated by TL3

**Predictions must be not QTL oriented!**

# Step 3 - ssGBLUP vs. BayesR

# Questions with GWAS and predictions

- Little or no gain with sequence data for ssGBLUP with commercial data
- GWAS by
  - % of variance explained usually per 1Mb
  - p-values
- Few regions explain  $> 1\%$  additive variance
- Lots of QTLs detected with small data sets
- Fewer QTLs detected with large data

# First conception rate on 2k Holstein heifers

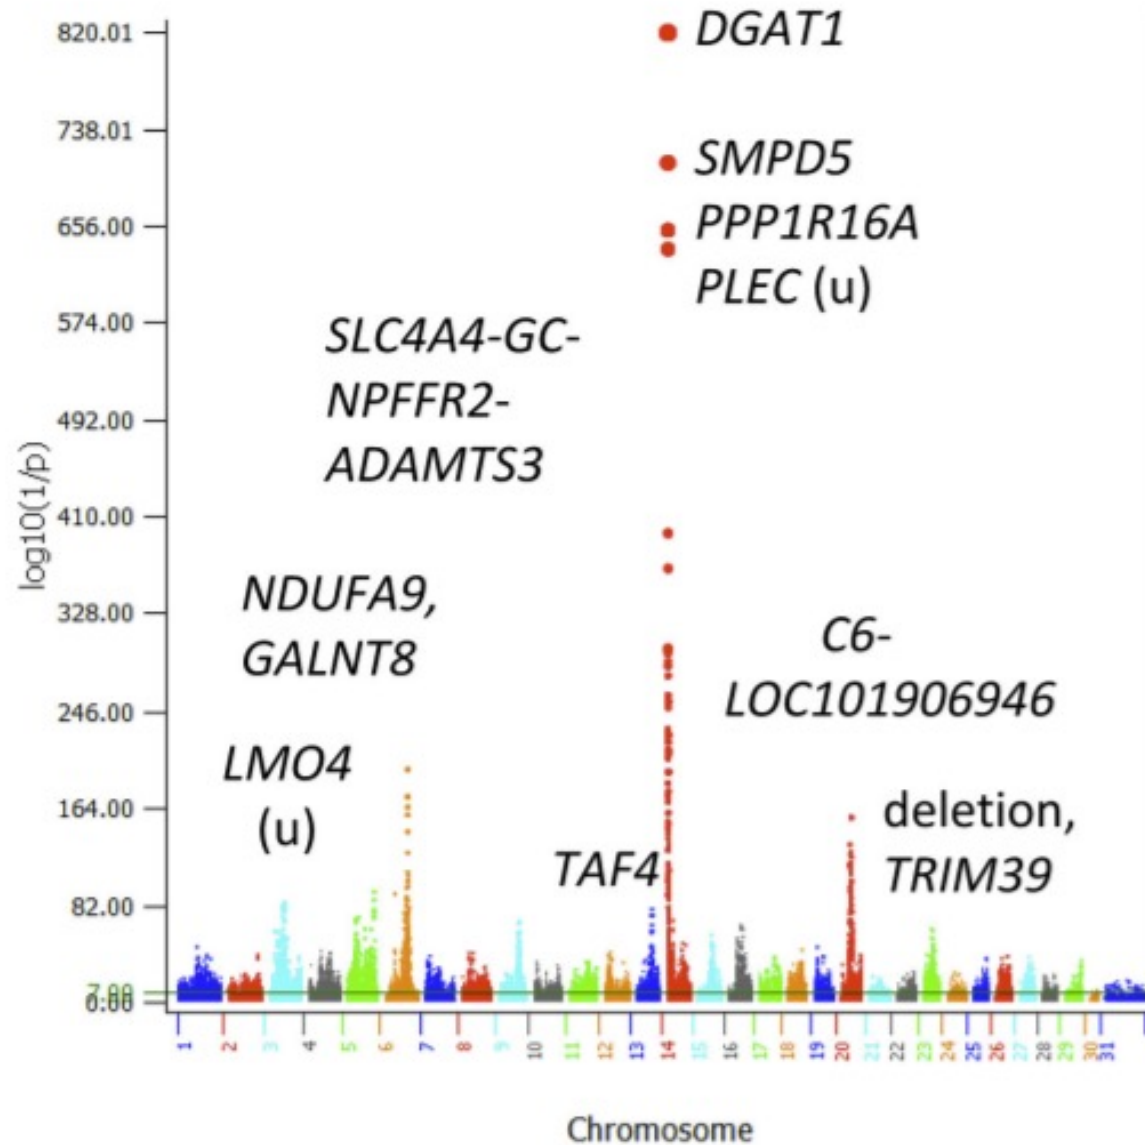

Estimated heritability 36% (normally 1%)

Identified 146 unique loci at  $p < 5 \times 10^{-8}$  level

Galliou et al., 2020, <https://doi.org/10.3390/genes11070767>

## GWAS on 294k Holstein cows

### A Milk yield: additive effect

Jiang et al., 2019

doi: 10.3389/fgene.2019.00412

# Manhattan plots for simulated population with 100 identical equidistant QTNs

Expectation

Based on SNP values

Based on p-values

# Plots averaged for 100 QTN

Pairwise linkage disequilibrium curve

~ 2 Mb for cattle  
~ 5 Mb for pigs/chickens  
~ 15 kb for humans

$1/N_e$  Morgans for 80% QTN variance  
 $N_e$  - effective population size

# What is Manhattan plot composed of?

QTNs

**Bigger with larger QTN  
and larger data**

Relationships

Noise

**Smaller with more data**

Combined

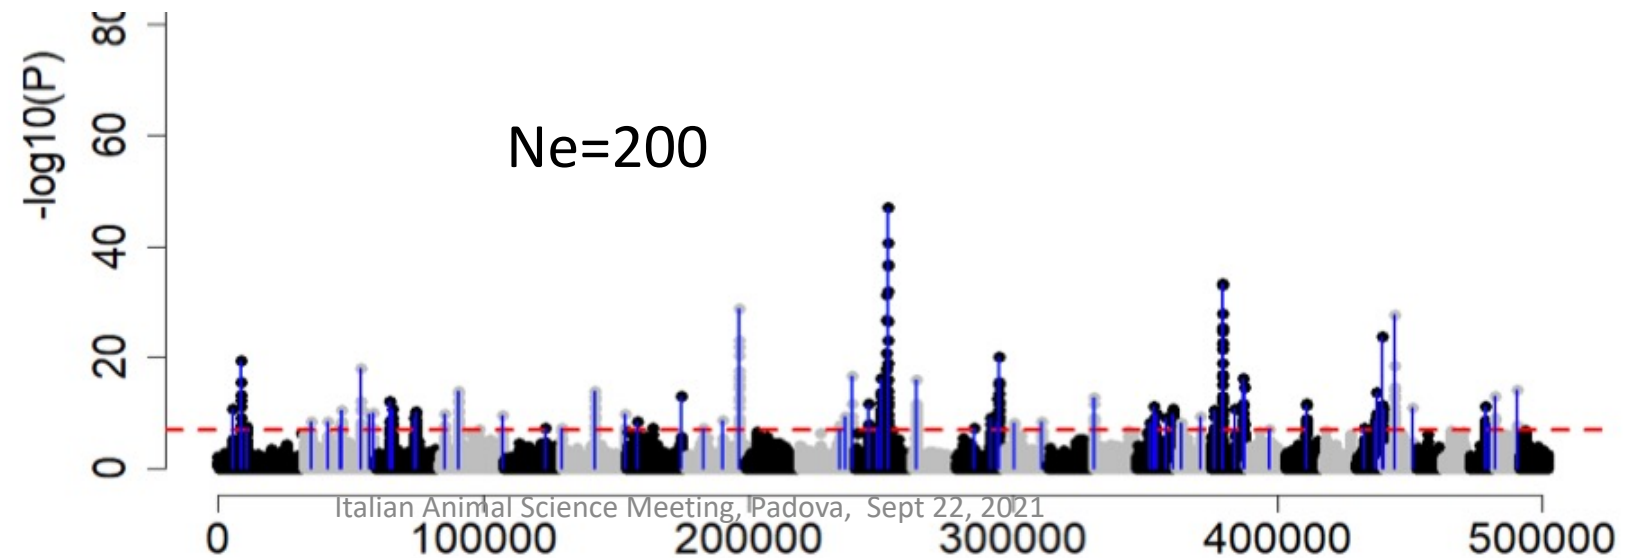

# Why ssGBLUP accounts for QTN?

SNPs cover QTN LD curve

# Effective population size affects GWAS

Sungbong et al., 2021

Italian Animal Science Meeting, Padova, Sept 22, 2021

# Distribution of QTL effects

# GWAS using 35k Holstein bulls

## Milk – first parity

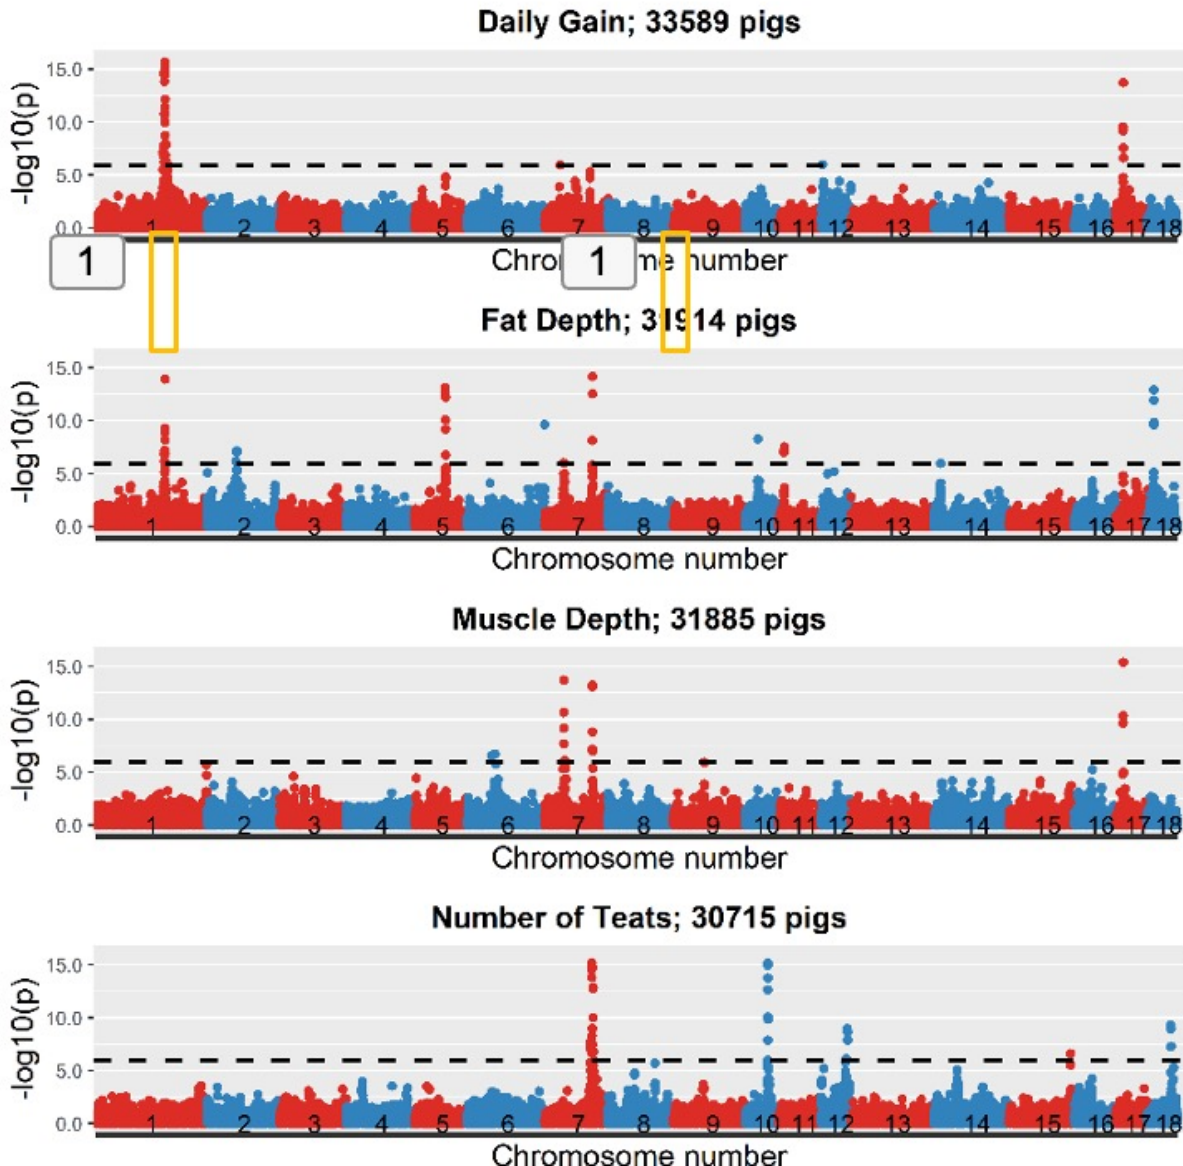

## Mortality – first parity

(Tokuhisa et al, 2014;  
Tsuruta et al., 2014)

# GWAS for various traits and index in pigs

Bijma, EAAP 23

## Index

- Different peaks in different lines
- Antagonistic pleiotropy

# Conclusions for GWAS

- QTN profile wide with small effective population size
- Large signals in GWAS due to QTN, relationships and noise (incl. Imputation)
  - If no LD curve, probably false signal
- Large QTL show pleiotropy – QTL not visible in index
- ssGBLUP accounts for QTL with large data

# Possibly Negative Impact of Genomic Selection

**Ignacy Misztal and Daniela Lourenco**

University of Georgia

# Negative effects of genomic selection

- Informal industry reports:
  - Deteriorating sow survival and pig mortality in pigs
  - Deteriorating feet & legs in beef
  - Short teats and increased calf mortality in dairy
  - Increased sensitivity to heat stress in dairy
  - Deteriorating disease resistance across species

# Genetic selection as optimization

- Selection for one trait or an index
- Gains on selected traits
- Losses on correlated antagonistic traits
- Losses compensated by improved environment/management

# History of selection strategies

- Domestication
- Unformal
- Large-scale single-trait for production traits
- Multi-trait with fitness traits
- Genomic

Received 4 July 1997; accepted 29 April 1998

...over 100 references on undesirable(cor)related effects of selection ... in broilers, pigs and dairy cattle....

Future application ... DNA-techniques .. ....more dramatic consequences....

Selection for more than production traits alone may prevent such.

# Hypothetical trend changes in 3 stages of genetic selection

# Trends for daughter pregnancy rate

# Changes in (co)variances in pigs due to genomic selection

### Heritability for growth

### Genetic correlation with reproduction

Hidalgo et al. (2019)

Heritability halved, antagonistic correlations  $-0.3 \rightarrow -0.5$

# Why changes in genetic parameters?

- Bulmer effect
- Changing resource allocation
  
- Changes in gene frequencies
- Changes in trait definitions
- G x E
- Recessives
- ...

# How to circumvent negative effects?

- Start or expand recording for problematic traits
- Update selection index
  - Needs estimates for last generation
- Focus on traits where the parameters are changing rapidly
  - Needs estimates generation by generation

# Possible changes in heritability

# Possible changes in genetic correlations

# Using theoretical and realized accuracies to estimate changes in heritabilities and genetic correlations

**Ignacy Misztal**

**University of Georgia**

# Realized and theoretical accuracies

Realized accuracy  $acc = corr(y - Xb, \hat{u})/h$

Legarra et al. (2008)

$y - Xb$  - adjusted phenotype

$\hat{u}$  - breeding value obtained without that phenotype

$h^2$  - heritability

Theoretical accuracy  $acc = \sqrt{\frac{Nh^2}{Nh^2 + M_e}}$

Daetwyler et al. (2008)

$N$  – number of genotyped animals with phenotypes

$M_e$  – number of independent chromosome segments

$M_e \approx 5k$  (chickens, pigs),  $10k$  (beef),  $15k$  (Holsteins)  
Pocrnic et al. (2017)

# Heritability by predictivity

$$\widehat{h^2} = \frac{c^2 + \sqrt{c^4 + 4c^2 M_e / N}}{2}, c = \text{corr}(y - Xb, \hat{u})$$

c - predictivity

Me – number of independent chromosome segments (about 10k in beef)

N – number of reference animals with phenotypes and genotypes

$$SE(\widehat{h^2}) \approx \frac{1}{\sqrt{N_{val}}} \left[ c + \frac{2c^2 + \frac{4M_e}{N}}{\sqrt{c^2 + \frac{4M_e}{N}}} \widehat{h^2} \right] \approx \frac{3c}{\sqrt{N_{val}}}$$

N<sub>val</sub> – number of animals in validation

# Heritability for milk in Holsteins

J. Dairy Sci. 104:5843–5853

## Genomic predictions for yield traits in US Holsteins with unknown parent groups

A. Cesarani,<sup>1\*</sup>  Y. Masuda,<sup>1</sup>  S. Tsuruta,<sup>1</sup>  E. L. Nicolazzi,<sup>2</sup> P. M. VanRaden,<sup>3</sup>  D. Lourenco,<sup>1</sup>   
and I. Misztal<sup>1</sup> 

<sup>1</sup>Department of Animal and Dairy Science, University of Georgia, Athens 30602

<sup>2</sup>Council on Dairy Cattle Breeding, Bowie, MD 20716

<sup>3</sup>Animal Genomics and Improvement Laboratory, Agricultural Research Service, USDA, Beltsville, MD 20705-2350

# animals with phenotypes and genotypes	580k
# animals with validation	381k
Assumed # chromosome segments $M_e$	15k
Predictivity	0.55
Initial $h^2$	0.35
Calculated $h^2$	0.33

# How to estimate genetic correlations?

Predictivity for trait i

$$\text{corr}(y_i - Xb_i, \hat{u}_i) = \text{acc}_i h_i$$

What is predictivity from trait i to trait j?

$$\text{corr}(y_i - Xb_i, \hat{u}_j) = ?$$

.....  
.....

$$\text{corr}(y_i - Xb_i, \hat{u}_j) = \text{acc}_j \text{corr}_{ij} h_i$$

$$\text{corr}_{ij} = \frac{\text{corr}(y_i - Xb_i, \hat{u}_j)}{h_i \text{acc}_j}$$

$$SD(\text{corr}_{ij}) \approx \frac{1}{h_i \text{acc}_j \sqrt{N_{val}}}$$

# Conclusions

- Response to QTL wide for pigs & chickens– several Mb
  - Probably false QTL if no LD trail
  - ssGBLUP accounts for QTL with large data
- “Good” large QTLs probably fixed, remaining show pleiotropy
- Potential negative effects of genomic selection on fitness traits
  - faster correlated responses
  - Potentially increased antagonism
- Need new methods to estimate genetic parameters – use of predictivity promising

# UGA AB&G team
